

Print, Verify and Reject..... Now you can do it all in-line!

PHARMACARTON CODING STATION

LOT 123456
EXP. 12/2008

The Pharmacarton Coding Station is designed for in-line, high resolution digital printing of lot, expiry and barcodes for pharmaceutical and medical cartons. The new design overcomes the problem of printing high density barcodes and 2D codes on line by totally controlling the carton during the print and vision process.

The turnkey system combines a precision multi-belt conveyor with a synchronised top hold down belt and can be integrated with an inkjet printer, and an OCR/OCV optical character verification system. A reject station with pack rejected confirmation complements the total design.

This fully integrated module provides pharmaceutical and medical manufacturers with an easy to operate, flexible system to meet a variety of coding requirements. The station is easily integrated into existing packaging lines using minimum space, and is adjustable to suite a range of carton sizes.
